### Automatic differentiation of algorithms : theory ...

Automatic differentiation is distinct from symbolic differentiation and numerical differentiation (the

method of finite differences). Symbolic differentiation can lead to inefficient code and faces the difficulty of converting a computer program into a single expression, while numerical differentiation can introduce round-off errors in the discretization process and cancellation.

### **Automatic differentiation of numerical integration algorithms**

Automatic differentiation (AD), also called algorithmic differentiation or simply "auto- diff", is a family of techniques similar to but more general than backpropagation for efficiently and accurately evaluating derivatives of numeric functions expressed as computer programs.

### **arXiv:1502.05767v4 [cs.SC] 5 Feb 2018**

The important realization that leads to automatic differentiation is the fact that even biggest, most complicated program must be built from a small set of primitive operations such as addition, multiplication, or trigonometric functions. The chain rule allows us to take full advantage of this property.

Automatic Differentiation (AD) is a maturing computational technology and has become a mainstream tool used by practicing scientists and computer engineers. The rapid advance of hardware computing power and AD tools has enabled practitioners to quickly generate derivative-enhanced versions of their code for a broad range of applications in applied research and development.

### **Automatic differentiation of algorithms : from simulation ...**

Automatic Differentiation is a technique for augmenting computer programs with statements for the computation of derivatives based on the chain rule of differential calculus. The ADIFOR 2.0 system provides automatic differentiation of Fortran 77 programs for first-order derivatives.
