$\Sigma\Delta$ -based closed loop gyroscope. The design is based on the equivalence between electro-mechanical $\Sigma\Delta$ noise transfer function and the noise transfer function of conventional electrical $\Sigma\Delta$. The method is applied to a fourth-order electro-mechanical $\Sigma\Delta$ containing the gyroscope and a second order electrical filter.

Avoiding Problems in Electrohydraulic Control Systems Design. Closed-loop control give machines great precision to apply force, lift heavy objects, or follow very precise motion profiles. Set up incorrectly, however, an electrohydraulic control system can be unstable and cause damage to products or be dangerous to people.

Avoiding Problems in Electrohydraulic Control Systems Design

Different closed-loop controllers were designed and tested in parallel in order to achieve the desired steady-state and dynamic regulated pressure response. A nonlinear dynamic model was developed for each valve then used to compare the performance characteristics of the valves.

The closed-loop controller is required to change its gains on-the-fly as the valve shifts between high-and low-gain regions. In theory, this valve linearization (compensation for the varying gains as a function of the control signal) can be done within the motion controller, using a look up table or a specific formula.
