2.1. Basic approximations. Meshless approximations for a scalar function  $u$  in terms of the material (Lagrangian) coordinates can be written as  $u(x,t) = \sum_{I \in S} \Phi_I(x) u_I(t)$  where  $\Phi_I: \Omega \rightarrow \mathbb{R}$  are the shape functions and the  $u_I$ 's are the nodal values at particle  $I$  located at position  $x_I$  and  $S$  is the set of nodes  $I$  for which  $\Phi_I(x) \neq 0$ .

Several methods have been developed to impose the essential boundary conditions weakly, including Lagrange multipliers, Nitsche's method, and the penalty method. As for quadrature, nodal integration is generally preferred which offers simplicity, efficiency, and keeps the meshfree method free of any mesh (as opposed to using Gauss quadrature, which necessitates a mesh to generate quadrature points and weights).
