Power analysis attacks exploit the fact that the instantaneous power consumption of a device built in CMOS technology depends on the data it processes and the operations it performs. CMOS technology is the predominant technology for (cryptographic) devices

Power Analysis Attacks

This holds for Power Analysis as for other Side Channel Attacks in general. Simple side channel attacks only analyze the side channel during execution of the cryptographic procedure.. Differential side channel attacks also analyze the system in other states (e.g. other operations on the CPU, etc.) and uses the differences in the observed patterns.Hence it is more complicated and time-consuming ...

In order to help you with your first DPA attack, we have prepared a demo script and workspace data, which allows you to mount DPA attacks based on two statistical methods. In addition, there are two scripts that facilitate plotting the resulting DPA traces. The demo DPA script does not require any special toolboxes of Matlab.

Matlab Scripts - Graz University of Technology

Simple power analysis (SPA) is a side-channel attack which involves visual examination of graphs of the current used by a device over time. Variations in power consumption occur as the device performs different operations. For example, different instructions performed by a microprocessor will have differing power consumption profiles.
