Abstract. The C++ language was created as an extension of C, which means that any program written in C is also a valid C++ program. However, experienced programmers typically make use of a set of high-level features made available exclusively in C++ as a way to control program complexity.

C++ Programming Techniques in Finance | SpringerLink

Abstract. Financial code implemented in C++ uses programming libraries designed to simplify the creation of fast, standard-conformant classes. The best example of such libraries is the STL (standard template library) itself, a convenient library that is included with standard-compliant C++ compilers.

Common Libraries for Financial Applications | SpringerLink

A very common activity in financial programming is the generation of price-related data that needs to be visualized by traders or other business stakeholders. Most of the time, the data is expected to be plotted in the form of a chart for easy visualization.

In the financial industry, for instance, it is common to have lower-level modules implemented in C++, with high-level analysis being performed in more user-oriented environments such as Excel, Mathematica, Matlab, Maxima, R, and Octave.

Using C++ with R and Maxima | SpringerLink

Abstract. C++ is an expressive language that can be used to develop some of the most sophisticated software, including the high-performance applications that are routinely used in banks and other financial institutions.
